

Getting the best out of your solar products

With the right product and a little planning, solar can and does work year round in the UK. Naturally what you can expect in terms of performance in the winter, is not going to be what you might get at the height of summer but it can still do a solid job for you.

A poorly positioned panel is often the crucial difference between satisfaction and disappointment when it comes to the performance of your product.

Put simply: The fewer obstructions between the sun and your solar panel the better your unit will perform.

Your solar panel should be:

South facing or
as near as possible

Outside of any
glass windows and
wiped clean from
time to time

Free from any
shadows; particularly
important between
10am - 2pm

Correctly angled
toward the sun
for the time of year
