

TRUEFLAME®

MINI SOLAR TORCH LIGHTS

Do:

Ensure your solar panel is South facing or as near as possible

Clean your solar panel from time to time

Don't:

Do **NOT** charge behind glass

Do **NOT** place your solar panel shaded areas.

User Guide

Thank you for choosing our TrueFlame Mini Solar Torch Lights. Please read these instructions carefully before installing and using your lights.

Setting up your light:

Always take care when setting up your solar lights. In the interest of safety, we strongly advise setting up your solar lights during the day while it is still light.

Installing your light:

Please take care when staking your TrueFlame Mini Solar Torch Lights into the ground and **never** attempt to do this with the light head or pole attached to the stake. Any damage caused to the stake, pole or light head as a result of attempting to drive them into hard ground is not covered by your warranty. If the ground is too hard, pour water on the desired area to soften it and make a hole using a strong metal object before driving your stake into that hole. Once the stake is in place, attach the pole to the stake and then attach the light head to the pole.

Operating Instructions:

The TrueFlame Mini Solar Torch Lights are fully automatic so once you turn them on they will come on automatically each night and turn off automatically after 7 hours. Please use the power button located on the light head to operate the light.

1st button press: Turns the light on in full brightness mode (Standard Mode).

2nd button press: Turns the light off

3rd button press: Turns the light on in half brightness mode (Powersaving Mode).

4th button press: Turns the light off

We advise putting your lights into Powersaving mode when the clocks go back in Autumn, you can then re-activate Standard mode when the clocks go forward in Spring. Powersaving mode should be used year-round if your light location does not face south, south-east or south-west.

Please remember that the TrueFlame Mini Solar Torch Lights are only as good as the location they are in. The lights will struggle to operate for long after dark if they are in a shaded location or a location that does not receive much direct sunlight - this is not a fault with the product!

Please note that the TrueFlame Mini Solar Torch Lights will not operate in daylight and it will not operate after dark if there are nearby lights shining near the solar panel. These can be lights from inside or outside your house or a neighbouring property.

Troubleshooting

My lights are on and it isn't dark:

Your TrueFlame Mini Solar Torch Lights have a sensor in the solar panel that tells it when it is dark enough to turn on. If your lights are coming on during the day it might be because the solar panel thinks it is dark when it isn't. This can happen in unusually dark conditions caused by bad weather, but usually it is a sign that the solar panel is positioned in a heavily shaded location.

My lights worked for the first few nights and then stopped working:

Usually the TrueFlame Mini Solar Torch Lights come partially charged so they will work for a few nights without receiving a fresh charge. If the light stops working after a few nights it is likely that they have not received a fresh charge during the first few days. Please check the location of your solar panel before switching the light off by using the switch on the light head. Put your lights in the best place to get sun and leave them switched off for a minimum of 3 days to allow the batteries to fully charge before trying the lights again.

I can not get my light to turn on and it never has:

Please check that there are no nearby lights shining on the solar panel after dark which may stop the lights from turning on automatically. You can check this by covering the solar panel with both hands and see if the light turns on. Usually the TrueFlame Mini Solar Torch Lights comes partially charged, but this isn't always the case. Please check the location of your solar panel before switching the light off by using the switch on the light head. Put your lights in the best place to get sun and leave them switched off for a minimum of 3 days to allow the batteries to fully charge before trying the lights again.
